BROODSTOCK MATURATION FOR SHRIMP

PRODUCT DESCRIPTION:

Broodstock Maturation feed is developed for feeding the selected shrimp broodstocks and to replace conventional fresh food such as polychaetes, squid and/or oysters. The feed is processed by advance extrusion pellet technology and is very water stable to reduce nutritional leach and maintain water quality. The formulation is developed by extensive research of nutritional science aiming to provide shrimp broodstock comprehensive nutrition.

BROODSTOCK MATURATION FEED AIMS TO:

- Replace live/raw food and lower production cost.
- Bio secure and easy feeding management.
- Stimulate ovary development of female shrimp broodstock.
- Increase number of nauplii production.
- Improve egg quality and increase nauplii hatch rate in post ablation.
- Prolong broodstock peak nauplii production.

Broodstock Maturation feed is highly attractive. It is possible to use as the stand-alone feed or supplementary diet in conjunction of polychaetes or other live feeds (*conditions apply*).

APPLICATION:

Recommend to feed Broodstock Maturation to the selected broodstocks one month prior to eye-stalk ablation as the stand-alone feed without live feed supplements. Ovary development of female shrimp broodstocks are noticeably improved during the feeding cycle leading to better production performance in post ablation. Depending on the desired performance Broodstock Maturation can be used as full replacement or partial replacement of polychaetes in post ablation.

FOR AQUACULTURE USE ONLY NOT FOR HUMAN CONSUMPTION.
